ELIMITE CREAM (PREMETHERIN CREAM) FOR SCABIES TREATMENT

Apply cream to entire body from the neck down, including body folds, hands, and feet. In infants, the scalp can be treated as well.

Do not wash off hands after applying the medication. Wash off entire body after 12 hours.

Apply the cream one more time, one week later. Wash off again after 12 hours.

After the first treatment, launder all bed linens, pajamas, and all clothing or place them in sealed garbage bags for 72 hours.

All household members are to be treated and all persons should be treated at the same time.

Itching may continue for several days to a few weeks after using Elimite cream. A soothing cortisone cream may be given to be applied twice daily to help with the itching.
